

H. Lab 8. Newton's Method

H1. Example. Algebraically find the root of $f(x) = x^3 - 10$ (solve $f(x) = x^3 - 10 = 0$).

$$\begin{aligned} f(x) &= x^3 - 10 = 0 \\ x^3 &= 10 \\ x &= \sqrt[3]{10} \approx 2.1544 \end{aligned}$$

H2. Formula. Newton's Method $x - f(x)/f'(x)$

H3. Example. Use Newton's Method to estimate the root of $f(x) = x^3 - 10$.

Take a guess for the root: $x = 2$

Apply Newton's Method: $x - f(x)/f'(x)$

$$\begin{aligned} f(x) &= x^3 - 10 & f(2) &= 8 - 10 = -2 \\ f'(x) &= 3x^2 & f'(2) &= 3(4) = 12 \end{aligned}$$

$$2 - (-2)/12 = \overset{\text{new } x}{\boxed{2.1667}}$$

Apply Newton's Method: $x - f(x)/f'(x)$

$$\begin{aligned} f(2.1667) &= 2.1667^3 - 10 = 0.1718 \\ f'(2.1667) &= 3(2.1667)^2 = 9.3892 \end{aligned}$$

$$2.1667 - 0.1718/9.3892 = \overset{\text{new } x}{\cancel{\boxed{2.1849}}} = 2.1545$$

H4. Repeat H3 in Matlab.

H5. Discussion. Why was Newton's Method invented? This gives a way to find decimal approx for exact values like $\sqrt{10}$. More importantly, not every $f(x)=0$ has a "closed form solution", so numerical approximation is the best we can do.

H6. Figure. Why does $x - f(x)/f'(x)$ work? See: Textbook p92, Figure 2.

$$\text{slope} = f'(x) = \text{rise} / \text{run}$$

$$f'(x) = f(x) / \text{run}$$

Cross
multiply

$$\text{run } f'(x) = f(x)$$

Divide $f'(x)$

$$\text{run} = f(x) / f'(x)$$

That was 1 iteration. Let's repeat.
